

ABSTRACT

DESIGNING THE USER INTERFACE OF MOBILE APPLICATION MONITORS ON HEALTH COMPLAINTS IN CHILDREN

A child is a very important period in the growing swell of a child. The health and resilience of the child's body is extremely vulnerable to attack disease and symptoms that are not normal can impact badly on child growing phases. Parents have to understand how to deal with cases that are common in children, but this knowledge are usually derived straight from their parents.

According to IDAI, infectious disease or NCD is not responsible for 63% of the population and mortality rate of 1.2 million child deaths in the world. However, most of these diseases can be prevented travel from an early age.

With the advantages provided by the virtual world about the motivation of individuals to use the internet is higher nowadays, an innovative media that can connect from one spouse to the other spouse, the information may be shared widely owned and can be filtered by the parents make the education process more easily and effectively it can be used to assist in the resolution of complaints of health problems that occur in children.

That's why designing a mobile application user interface design monitors health complaints in children so that it can help resolve complaints of health problems that occur in children.

Keywords: design, mobile applications, sharing, health complaints, child.
