

ABSTRACT

Technology is evolving at this point widely used by some companies such as airlines that use centralized on the navigation tower air traffic control (ATC) in the areas traversed in order to avoid the lane change has been given. By using the Honeypot on KFSensor, attacks carried out against the server on the Air Traffic Control (ATC) can be determined by monitoring method is installed on a Windows server, the monitoring information contains the IP address of the attack that makes it easy to do the analysis. Examples of attacks that often occur as telnet, port scanning etc.
