

ABSTRACT

Blood donation is the process of taking blood from a person voluntarily to be kept in blood banks for later use in blood transfusions. Routine blood donors is usually performed in a local blood donor center. And every time, there is also raising blood donation held in crowded places, such as shopping centers, large corporate offices, places of worship, as well as schools and universities. At this event, the donors can be made time to come and contribute without having to specialize come to the blood donor center. Prototype applications created with the aim to bridge donors with recipients so that the distribution of blood to be faster, Built using the Android platform and use features such as SMS gateway.

Key words : Application of prototype, Android Platform, SMS Gateway
