

ABSTRACT

Telecommunications world is growing rapidly. The internet is part of life today even most people are very dependent on the internet to do daily activities such as doing office tasks, online shopping, social networking even to order food can also be accessed by the internet, and many other activities. Besides being able to be accessed from computers, the Internet can also be accessed from mobile (phone, PDA, android, etc.). The development of mobile applications is currently very rapid, it's no wonder that's why more and more people access the Internet by mobile than using a computer because it can be accessed anywhere and anytime.

Because of that, there is an idea to create a mobile application that can access internet to order food. Only by access these application from their mobile, people do not need to go anywhere to order food. Hopefully with this application can help people, especially for people who busy to work.

The Application program use a WAP (Wireless Application Protocol) technologies. WAP is a standard communication between mobile telephone devices with existing information on the internet. Digital cell phone or mobile terminals have facilities WAP, can read the contents of a site on the internet in a special text format.

Keyword: WAP, mobile.
