ABSTRACT

At this time the city of Bandung is one of the most densely populated cities in West Java . For the community and other parties , at this time if you want to get information about demographic data should go to the Department or related agencies . To facilitate accessing data quickly and accurately , we need a system that can display information data related to population distribution . The information system must be easy enough to be understood by all users .

One of the tools that can be applied to the present data quickly , accurately and easily accessible is by implementing a geographic information system as a medium to deliver relevant data for a particular population Spread Bandung city .

Based on the results of tests performed it was concluded that the presence of the geographic information system, the people become easier to gain access to information, especially in terms of population without having to go to agencies and related institutions that provide demographic data.
