

Abstract

Quran Research is very important to the Moeslims, but unfortunately the implementation of this research is still done manually, for example, searching the verses of the Qur'an that contain certain words that will be used as an example. By doing concordance-based search, this method will help us to search the entire paragraph containing certain words with similar entries. Not only that, concordance can do a word-processing that will produce a more complete additional information. One function that can be used to help us is marcov theoretical assumption about n-grams. N-Gram will assist in searching the related information about combination of words and also the words around it

Keyword : *Al-Quran, concordance, n-gram.*
