ABSTRACT

Waste is something that has been unused resulting from a process of manufacture or production of an industry as well as from the results of household use. All that is better known as waste that its presence is not desirable because it has no economic value. One of the human waste is paper. The solution needed to tackle waste paper is to recycle the waste paper into a module and a sheet for fashion products. This research is a qualitative research. Data collection techniques used include literature study, observation, exploration and interviews. The exploration process undertaken in this research is the processing of waste material from HVS paper which is processed to change the visual and texture by doing it a slurry process. Then it can generate new textures, new shapes and new colors. The use of paper base materials in this study is expected to reduce a little of the amount of paper waste that is available. Have the opportunity and potential development of product materials that are not common or different from the existing ones which can then be developed into more explorative accessories. Easy during the treatment process is also used as the reason to choose the manufacture of these accessories compared to other products such as one of clothing.
