

ABSTRACT

Pulau Pari is one island that has a lot of tourism potential in it. The existence of potential tourist sites need to be developed again with an increase in infrastructure and facilities such as a better support facilities. One of the facilities is required, a more adequate shelter. Cabana is a place to shelter that has a roof and some walls, usually placed by the pool or beach. In some places, the primacy of cabana compared to other peneduh facilities, the facilities therein, more complete and more impressed. Cabana products placed on the waterfront, require more attention towards the use of the material. Where in terms of research, performed research on direct observation of the field. The material is an input in the production process, or as raw materials are processed or processed into finished goods. The material is an important component in the design of a product. Especially on designing product Island rays, due to the environmental conditions that require the use of specific materials in accordance with the conditions of weather and climate. Research on the use of the material is very influential to the quality of the product itself. A good quality products will give you comfort and attraction to visitors tour the island Pari. Thus the material aspect of the approach applied in the design of the Cabana, in Pari Island sights to get the best material on the design of the product. This design using the materials and finishing the already adjusted from results based on analysis of environmental conditions and other matters.
