

ABSTRACT

Rice field is one of the fields that exists mostly in Indonesia, and produces lots of yields includes abundant agricultural wastes. One of those wastes that mentioned above is rice husk. Rice husk is the outer part of paddy that covers it, convex shaped and golden-yellowish colored when the paddy is ready to be harvested. If the rice husk wastes are being left accumulated, unbalance of ecology will arise. Some people only use this waste as a farming media although actually there are lots of way to make a better use of this waste; chemically or by using it to be material of ready-to-wear products like jewelry. Advanced explorations are needed in order to find another potentials of rice husk, so later, rice husk can be used as a material for another purpose of product making besides jewelry which can lead to be alternative livelihoods for the people who lives around the rice fields and can be sold widely, also easy to be produced.
