ABSTRACT

Web-Based Rubber Booking Application is one application that can help customers to order rubber online, especially for customers of CV HFM. Why is this Web-Based Rubber Ordering App? Because there are some problems contained in CV HFM is that if the customer wants to order rubber then the sales or one of CV HFM employees must survey to the client place to talk about the rubber with the client, the second problem is the customer still can not monitor the data orders, third is in terms of payment process, customers still have to meet with the CV HFM somewhere, eg meet at a certain point, such as COD's layanknya or take the goods in a predetermined place. The solution provided is the creation of Web-Based Rubber Reservations Application that can assist companies in processing order data, helping customers in ordering rubber online, helping customers to monitor order data and help customers to confirm payment. The process of building a solution is by using prototyping method, why use the method? Because this method can make the client and developer establish a good communication, the implementation of the system becomes easier to do, cost and time efficiency, and the client can provide input to the system according to his will. The results of the can from using this prototyping method is the number of inputs obtained from the client who will build the developer to will continue to innovate in thinking.

Keyword: ordering, customer, prototype.
