

ABSTRACT

Panti App (Operational and Donation Management Application) Web, Finance and Household Based Module is an operational management application that focuses on the administrative system of administrative institutions, especially the financial, asset and kitchen units. As for the background of the writing of this final project report is asset management data processing that is still carried out conventionally and not detailed so that it causes problems in data processing and checking of goods, there is often damage and even data loss in the data reporting system of nursing homes and shopping homes and the frequent occurrence of recurring financial data recording because the data is not integrated so that the basis of the problem formulation is how to help the Institution in overcoming these problems. This application was built using web-based Prototype method using CodeIgniter framework that utilizes object-based programming techniques in PHP and uses black-box testing techniques that are focused on the output produced by the application.
