*Abstract: The city of Bandung as a supporting city of the capital city of Indonesia, namely the developing city of Jakarta has a very high population density. Based on the 2010 population census, the city of Bandung has a total population of 2,394,873 people. Around 50% of the population of Bandung is dominated by West Bandung. With the ever increasing population, certainly making facilities and infrastructure in West Bandung become important . One of the facilities that support the creation of health for the teeth and mouth is the Dental and Oral Hospital. In fulfilling dental and oral health facilities and infrastructure, the city of Bandung government strives to improve the quality of the Dental and Oral Hospital. However, without realizing there are several problems that occur in the Dental and Oral Hospital and dental polyclinic in public hospitals both in terms of facilities, standardization and interior. Common problems, including the facilities available at the Dental and Oral Hospital, do not meet their classification standards, requiring upgrading of hospital types given the increasing number of visitors but limited facilities. Other problems, such as lack of processing of interior elements so that the interior looks monotonous and boring and does not provide comfort to the user. Therefore, efforts are needed to improve the dental and oral hospital structure through this design with the aim of being able to answer the needs of users according to the ideal standards of health facilities that can support dental and oral activities in order to create a sense of comfort for users.*
