ABSTRACT

The web-based application for monitoring and contract labor assessment is a web-based application used in the BNN in West Java Province to assist in monitoring performance activities and conducting performance appraisals to contract employees (TKK). This application can help TKK employees in inputting their activities and obtaining information on performance assessment indicators and as a means of reporting. Making this application is done by the SDLC waterfall model according to Ian Sommerville where at the software requirements analysis stage the interview method and observation are used with the Head of Subdivision and implemented using the PHP programming language, CodeIgniter framework, and MySQL database. Based on the results of testing and questionnaires it can be concluded, this application can help BNN in the process of reporting employee activities that have been inputted by TKK employees and applications can be used to see the results of the assessment and verification process sent by, to ensure the results of research on TKK assistance.
