ABSTRACT

In 2013, the Government issued a new learning curriculum. This curriculum is referred to as Kurtilas or Curriculum two thousand and thirteen. In this curriculum, the government determines the delivery of Thematic-based learning for children. Basically, thematic-based learning is learning where there is one theme that is held several subjects combined, so that children can immediately learn the various lessons. This learning system will make children seem like playing during training in each lesson. To facilitate this training process, a thematic interactive learning media for children in elementary school based on Android is designed. The results of designing this application can be seen in this Final Project report.
