SAP Business One which is implemented by SME Companies (Small and Medium Enterprises) still requires system adjustments to fulfill company needs. So to achieve these needs a web application system that is integrated with SAP Business One is developed by taking a case study of stock opname. The reason is because the Stock opname process carried out by SME companies is still done manually in that the employee checks and records the available items and reports to the manager so that the data is not processed in real-time and results in misinformation about the availability of goods in the warehouse. It is expected that the Stock Opname web application system that is integrated with SAP Business One can overcome the problems in the SME management process so that it provides accurate and real-time inventory information and integrates with other business modules at prices that SME companies can buy.
