

ABSTRACT

Pelabuhan Jakarta Hospital is one of the class C health institutions under PT Pelabuhan Indonesia II. This hospital was established in 1978 with the physical condition of the building which still retains the shape of the old building with a more modern facade cover. Along with the increasing number of health facilities in North Jakarta and the development of types of health services such as BPJS, Pelabuhan Jakarta Hospital need to be redesigned to have better spatial planning with more adequate facilities.

Medical factors are not the only factor in healing the patient, but also the environment and psychological condition of the patient towards the environment. The environment is the main thing because not only patients but also other space users such as paramedics and employees who need environmental optimization of behavioral psychology. Through the method of analyzing objects and interviews, problems are formulated relating to the design of the interior of the Hospital.

The design of the Hospital is based on spatial problems that affect the psychology and behavior of patients or space users both in examinations and in the healing process. The interior design with marine concept aims to optimize interior functions related to personal space, territorial, accessibility, and facilities. This hospital is expected to improve the comfort and health conditions of all users.
