

ABSTRACT

Rapid development of technology in this digital era leads to accessible information anywhere through an internet. This begins to threaten the position of a library as an information center. Whereas, technology facilities in most libraries in Indonesia are not keeping up with the times so they cannot meet the needs of modern society. In addition, the lack of libraries in Indonesia that emphasizes the beauty of interior design has also made the libraries seem boring to the people, including in Bandung. This was proven by the number of visitors to Dinas Perpustakaan Umum Kota Bandung in 2017 that did not reach one-third of the target visitors. To restore the image of the library and attract the public attention, the library can improve its facilities and create a pleasant interior atmosphere and comply with the changing lifestyle as well as needs of the people according to the era development.

The design of Bandung Public Library will apply the "Urban Lifestyle" concept. The aim is to create a library that can meet the needs and tastes of modern society, represented by Millennials as the largest population at the same time as generation born together with the technological development which makes them have different characters, lifestyles, and significant ways of learning from previous generations. By implementing the concept, it is expected that the library interior design can create a pleasant atmosphere equipped with technology-based facilities so as to attract the interest of the people to visit the library.
