

ABSTRACT

The development of the design of the playground design aims to develop motoric power and social life in children which is very important for the growth of children in this Indonesian land. This playground will be redesigned into a game facility that falls into the modern and simple category. Some of the playgrounds chosen to be redesigned are the playgrounds which include swings, slides, climbing bars and hanging bars. The vehicle for the game is the most loved by children. In the beginning the playground was a game facility that was made for playgrounds in the backyard where there were only houses, places to climb and swings, but over time the playground had turned into a diverse playground. This playground is usually played by children for fun and usually the playground is made of wood and iron. However, as the times evolve and there is less garden land, playgrounds have now rarely been found in some parks. The playground that will be designed is not changing the material used, but adding or changing the shape to a more modern and simple feature, so that the display is more attractive and makes this playground a playground that can be used in garden areas with less extensive land. Playground is not only used for playing facilities, but for increasing motoric skills of children and increasing social life in children at an early age. Playground users who will be redesigned are none other than children over 5 years old, because this playground is minimalist in size, but can also be played by children under 5 years old but must be under the supervision of parents or adults.
