

ABSTRACT

PT Saba Transindo is a company engaged in heavy cargo shipping services. Currently all the recording processes carried out in the company are still manually, the rates for determining shipping costs is still in negotiations between the two parties, so that the profits from shipping are not maximal and are not managed systematically, and management of records is only based on delivery notes the operational cashier of this recording is still in the form of recording in Microsoft Excel. Recording of income sometimes has problems because they have to wait for delivery, delivery orders from drivers who have to travel long road. And management of payment of expenses and salaries that are handled by the owner manually. To overcome the problem above, then a web-based application is made for the management of freight forwarding and calculation of cost rates, as well as managing payment of operational expenses and payment of wages of drivers who make deliveries. Applications are built using object-based development methods. The development process uses a prototype method (prototyping model). Using Codeigniter Framework programming language with Hypertext Preprocessor (PHP) script language.
