

ABSTRACT

Bandung Zoo is one of the natural attractions of flora and fauna in the city of Bandung. In addition to providing infrastructure for flora, fauna and performances, Bandung's zoo tourist attraction also provides recreational vehicles to facilitate tourists who visit as family recreation, children and education. The distribution of feed to animals that still use manual systems and standard equipment generally makes the problem serious and solutions must be sought. The problems that occur include the distribution of animal feed systems that are less than optimal, giving rise to new and most fatal problems leading to the death of animals. The purpose of designing these animal feed distribution aids is expected to help optimize the distribution of more efficient.

Keywords: Distribution, Animal Feed, System.
