

ABSTRACT

City Park is one manifestation of urban open space which is very important for a place to facilitate the community. Many benefits of building parks in urban areas, namely beautifying Public Spaces, Recreation, and the use of sports facilities and work space.

The research approach used is descriptive qualitative, namely research conducted by processing data from interviews and observations in the form of data and analysis, based on direct observations and through questionnaires in Bandung City Music Park, most visitors from SMAN 5 and various visiting destinations such as hanging out, doing assignments, as well as sports. But behind that there are some problems that observers see and visitors feel, such as lack of trash cans, lack of audio and needing additional decoration that smells of music, but theater seats are the object. research, because theater seats have the main function as a seat for visitors but are not optimal because they do not have a table and roof, so when the weather is hot and rainy, visitors must leave the place, feels less than the maximum function of the music park itself,

From all these problems, this research focuses on designing products that can maximize the function of theater chairs in every event activity, even when it is raining or scorching.
