

ABSTRACT

Humans are given vision that can capture visual images. In normal circumstances, the human eye can capture light biasan and color well. But what about the case if a deviation occurs? Visual deviations can occur naturally, such as aging, impaired retinal muscles that are weakened to nearsightedness or nearsightedness, the aging factor can usually result in decreased color capture that becomes more monocormatic. On the other hand, brain function that is affected by external substances can affect the visual system such as addictive substances and alkoho if consumed in large quantities. In addition, preaching can also have an impact on amplifying the effects of addictive substances that trigger the imagination as if it is evident by the sufferer. In the realm of art it is common knowledge that some artists experience visual impairments such as Vincen van Gogh and pour it into art form. In addition, in terms of fine arts, it needs a balance where the audience can enjoy a work with sensory pleasure without having to worry too much about thinking about works that are too complicated. And basically that is where the charm of the art beauty emerges, before finally developing as it is now by combining other disciplines to strengthen the artwork itself.

Keywords: *visual distortion, addictive substances, imagination.*
