ABSTRACT

Student Monitoring System is a method or system that aims to supervise the development of the student's Final Project. In order to monitor the progress of each student's Final Project, and make it easier for supervisors and the PA team to provide direction in completing the PA.

Due to many factors that cause delays in the completion of a PA, one of which is not monitoring progress in the process. So we will create a system that is integrated with the GitHub API and GDrive API which makes it easier for supervisors and the PA team to monitor PA work and produce better results.

The system development method used in the design of the student PA Monitoring System is the Agile Software Development method. The purpose of making this student PA monitoring website application is to produce a monitoring website for student PAs, especially D3 RPLA Telkom University. The information provided for students in the monitoring website application includes artifacts of submitted student PA documents and progress in implementing the application.
