

ABSTRACT

Goal-driven office management is the key to the success of any organization or business, therefore it makes sense that any organization or business would constantly look for ways to improve its operating system by improving the performance of its employees. The purpose of the WorkWatch application is to monitor and record employee activities in an organization.

The solution to monitor and manage the work activities of workers in a company is the WorkWatch application. To accommodate users with different responsibilities, the software offers two types of accounts: company and employee. In the company account type, WorkWatch offers various features including a company dashboard that provides an overall view of employee performance, a list of current and completed jobs, a list of registered employees, and attendance records. The ability to add, edit, and delete employee records, payroll records, and attendance records belongs to the administrator.

In the employee account type, WorkWatch provides a dashboard that shows assigned tasks and absence status. Employees can view the attached work files and complete the tasks in them using the app. In addition, members can easily perform absorption exercises.

So, certain data and functionality can only be accessed by authorized parties, so your application is opened through a differentiated login system for company and employee accounts. Companies can improve human resource management efficiency, increase employee productivity, and gain better insight into the status of ongoing projects by using WorkWatch. To help businesses monitor, analyze, and improve employee performance, WorkWatch is an effective and integrated solution.
