

## *ABSTRACT*

*The library is a public facility that is very useful for the community, especially children and adolescents. They need this facility primarily to support educational infrastructure. However, the arrival rate of people is still minimal in Indonesia due to many factors, especially inadequate facilities and boring visual appeal. The development project in this Final Project ultimately focuses on the formulation of the problems that can be drawn from these problems, namely: facilities for the library to attract visitors, creating a conducive atmosphere to reduce noise, choosing the right circulation and the right layout for sufficient privacy for library visitors. The making of this design project is supported by observation, documentation and interview methods to obtain primary data as well as literature study methods, comparative studies and precedent studies to collect secondary data for further analysis. With the current conditions and lifestyle of the people in Bandung, the library itself must keep up with the times that are currently happening in order to meet the needs of the community.*
