

ABSTRACT

Hospital is place of service of public from the angle of health, like polyclinic, UGD, medical checks up etc. Data of the patients, employee hospital. At the moment still many hospitals using patient data system, either new or old having the character of traditional and manual. The system still relying on performance staff and documents requiring room larger ones menyimpan to. With existence of technology RFID management system which still be traditional can become more efficient.

Radio Frequency Identification (RFID) be technology compact wireless which in exeeding orthogonal transformation of world to commercial. And now RFID can be applied in health area. system RFID offers efficient improvement in patient data, drug administration consecutively and correctness for patient, knows location of patient, and payment automatically. Data kept in an small object (RFID tags) cans be in the form of bangle, choker or card.

The purpose of this final project is apply technology RFID will make automatic system of patient data. The system would incircuit with database comprising information of patient, information of medical doctor handling the patient, blood group, condition of health and handling will which be given for patient.
