ABSTRACT

Recently the development of technology is growing fast. It also has a positive impact to telecomunication issues. More applicated dan developed telecominications technology such as GSM (Global System for Mobile) make an impact raise more customer time by time. Then make an uncertainly wave of customer higher. The uncertainly number of call make a server of telecomunication work not optimal. We need a system that can predict the number of customer of GSM with time series prediction.

In this final project studied about time series prediction in telecommunications scope is predicting calling movement that use a seerver with Elman recurrent neural network. Elman recurrent neural network is used to predict number of custumer for a next day based on historical data. Based on the result of this final project, these are some factors that influence accuracy of prediction result, such as acrhitecture of artificial neural network in this case used Backpropagation Through Time, learning rate, weight, and epoch. And accuracy rate from sistem 95%. And the highest accuracy is 95.8168% that used archytecture 30 10 1, Learning Rate 0.01, and Epoch 1000 times.

Keyword: number of calling, prediction, time series data, Elman Recurrent Neural Network.
