Abstract

Steganography is a type of hidden data. Steganography can be done by hiding the data in time domain and frequency domain. Spread spectrum can be used to spread the data in frequency domain. Spread spectrum method hide the data by spread it in domain frequency by using Psuedo Random Generator. Psuedo Random Generator used for random the data before it hide in file carrier in frequency domain. To change in frequency domain can be used Discrete Cosine Transform (DCT) and Discrete Wavelet Transform (DWT). From the result of test got that MP3 steganography using DWT is better than DCT. For a big hidden data, steganography in speech audio type of MP3 have better perform than band audio type.

Keywords: Spread spectrum, psuedo random generator, discrete cosine transform, discrete wavelet transform.
