

Abstract

Telkom Institute of Technology is a big place. There are a lot of people, a lot of organizations, all with their own means and purpose. Each organization of course has their own information to be shared with their member. And currently, the most used way to spread those informations are through wall magazine, pamphlets, and mouth to mouth.

How about taking advantage of the established intranet network inside the campus and use it to spread the information? This application was built based from that statement. So, instead of just relying on conventional ways of spreading information, this application will add one more way to trade information. And it will make information distribution easier.

Information Board Web Application was made using HTML with PHP/MySQL handling the database process. And it also capable of playing various multimedia material like sound, pictures, and animation. The final goal of this application is to create a media that can deliver information easily.
