

ABSTRACT

Tax is the most income for Indonesia and tax can be collected by dinas pendapatan at center and region. During now, data management is not good, especially at west java province. Data management still doing by manual process or doing by the present application like Microsoft Office ex: Ms. Word and Ms. Excel. Many times something wrong happen when the government employee want to input the data, a mistake in the count of data, and when the employee want to see the past data, they find difficultly that because the stack many of data from many year in paper type. Even there is a risk that's the paper can be lost.

For this reason, made an application to make easier data management in dispenda. This application can make easier the process data input which received from county and city, calculating of tax data income and percentage of income, and make easier employee to find the past data that's they want to see.

This application was built using a programming language HTML, CSS, JQuery and PHP with CodeIgniter framework and uses MySQL database.
