

ABSTRACT

Teknos genius is a service company specializing in the field of education, namely as a tutoring agency located in kab. Sintang. In Teknos Genius run the operation requires some fixed assets supporters but from the beginning to the end use of the acquisition has been no special recording of the assets of the company. The calculation of depreciation is done in a way so that there is no report estimates the complete assets that can be generated by Teknos Genius.

Based on the issues that have been described, built a web application that can manage the acquisition of assets from the beginning to the end use and location of the assets. This web-based applications built with object oriented with the development of the SDLC model and using the PHP programming language and CI framework. This application can handle the whole process that occurs in the fixed assets of the company from the acquisition, placement, transfer, depreciation, repairs, revaluation, termination, sale and display card fixed assets, card debt fixed assets and reporting of fixed assets to meet the needs of information about assets in the company.
