

ABSTRACT

In Indonesia fashion industries develop rapidly and more forward, make variant of fashion products with different period of usage increase. A lot of fashion products with a short term usage cause the pile of unused garments in several places, those unused garments pile up with a lot of reasons, not just because the life time is done but with other factors such as the consumer saturated with the garments or in many other reasons. There are many unused garments deposit in the closet with zero usage or they sell those garments at the thrift shop or traditional market. Usually to make the life time use longer we need to process those garments and decrease the garment agglutination. Reduce, reuse, recycle and the DIY (Do It Yourself) tenet hopefully will help decrease the amount of unused garments. Lack of variation with processing unused garments inspired the writers to magnify new way for processing all the unused garments with surface textile design technique and develop the garments to new fashion products. The results of this research hopefully inspire other people to use different variation techniques in term of processing the unused garments and help decrease the problem. This research will put out fashion products with new technique of processing. New methods of processing the unused garments with different techniques such as shredding, tie bleaching, foiling, flocking give the garments new texture and feel. Writers also did a lot of interviews with the merchants and store keeper also recite a lot of literature in order to complete and support this research.
