ABSTRACT

The purpose of this research is to develop information systems point of sales at My Gym-based website. This system can simplify, speed up and reduce the error rate in the management of both data sales, purchasing, and availability of stock products. The issues at My Gym is part of the sales are still difficult to manage the transaction and update inventory data is not accurate.

Web point of sales would eventually create a system of online sales so enthusiasts a gym is not necessary to visit the cashier My Gym directly to make purchases, sales system is prospective members only need to enter personal data that will be directly checked immediately by admin on continue the process of ordering, buying up the payment process. In developing information systems point of sales using SDLC (*Software Development Life Cycle*) methodology with four stages, analysis, design, code, test.

With the construction of this application is intended to facilitate the company, especially in managing the sales department sales data.

Keywords: Information Systems Point Of Sales, Website, SDLC methodology.
