

ABSTRACT

The Bougenville Hotel Bandung is a newly established hotel for six months therefore The Bougenville hotel is classified as a new hotel. Due to The Bougenville classified as a new hotel, the process of booking a room, check in, and check out the hotel room is still using a manual way by taking notes in the operational book run by the front office. Therefore, Web Room Reservation Application Reservations are made. This application will be built with software development method with PHP Programming Language and in managing its data base will be used MySQL. In this application there will be features of hotel room reservations available as well as the type of rooms that can be booked online by hotel guests. In addition to online booking, the application also provides direct booking for front office managed, managing check in, check out, room data, promotional data by the front office. Housekeeping also manages applications to update the availability of cleaned rooms after occupancy by hotel guests to make room reusable. The manager will use the app to view reports and guest reservation data.
