

Abstract

Making the software begins from determining the software requirements and testing. The software will pass the stage of testing Software Development Life Cycle (SDLC). User Acceptance Test became one of the stages of testing in SDLC. The Test have to fit with software requirements that have been determined.

In this final project will explore one of User Acceptance Test (UAT) method with automated test framework FitNesse. Broadly speaking, UAT needs software requirements to testing the software. Automated framework test used because it can give a quick feedback to give information that the test is success or fail.

Keywords : User Acceptance Test, FitNesse, software requirements, Automated Test.
