

## **ABSTRACT**

JTS (Mobile Telecommunication Network) is a part of PT INTI tbk that build mobile telecommunication network project. Some Data that we need to build this project are marketing, engineering, logistic, finance, operational, and SDM data from the project.

Due to system that used of mobile telecommunication network project was not computerized, the project data become not structured and not integrated each other, that made the employee difficult to do data management. This software expected to do management data of mobile telecommunication network by web based interface. So we can access and management data more fastly, easily, and savely, that can help employee and manager to management ang building their mobile telecommunication network project.

Method that used to develop this software is waterfall structure method, the implementation used PHP and Oracle 9i as its data bases, system modeling used Ms Visio 2002, and Macromedia Dreamweaver as its web design.

Keyword : data management, building mobile telecommunication network, web
