This study is a quantitative study involving 400 respondents as a sample. The way of data collection is done by distributing questionnaires using five Likert Scale points. Statistical analysis technique that is done is descriptive analysis and multiple linear regression analysis for hypothesis testing, and for data processing researcher using software SPSS for Windows Version 20.0.

The result obtained is known that all partial independent variables have a significant influence on dependent variable, simultaneously product quality and service quality have a significant influence on consumer repurchase intentions. From result by the analysis of doubled linear regression known $\mathbf{Y} = -0,160 + 0,303\mathbf{X}_1 + 0,661\mathbf{X}_2$ which mean that service quality variable have bigger influence than product quality. For the value of determination coefficient is 0,348. It shows that product quality (X1) and service quality (X2) have 34,8% influence to consumer repurchase intention (Y) while 65,2% is explained by the other variable not used in this research.
