

ABSTRACT

Cancer is a disease that requires special treatment from both treatment and facilities during the recovery. There are four important steps taken in handling cancer cases, which is promotive, preventive, curative, and rehabilitative stages. Currently, the promotive to curative stage can be handled by cancer hospitals and public hospitals. However, the rehabilitative stage tends to be ignored or even not facilitated. The needs and character of cancer patients in a fairly specific rehabilitation period require the availability of well-planned cancer-specific medical rehabilitation facilities.

The design of the Cancer Medical Rehabilitation Facility uses the concept of "Stress-Less Design" where the rehabilitation room can be a place that can provide ease in every therapeutic activity and provide comfort in space so as to reduce the feeling of stress and depression experienced by patients suffering from cancer. This concept will be combined with the application of a natural atmosphere inspired by nature. The Nature-inspired design theme was chosen to provide a comfortable, fresh and relaxing atmosphere obtained from the application of natural elements. This design is expected to have a positive impact on therapeutic and psychological activities of cancer patients.
