

Abstract

The topic problem is to use words on the internet. People can see what it is even it's ugly, good, or even bad. Many people do this research to run automatically because there are many words in the internet. Telkom tries with its healthy internet. The government is also trying to block it. In general, the research that has been done has been considered satisfactory. However, it doesn't always guide users where there is a good but blocked website. One solution that was tried was the replacement of words so as not to interfere with profitable websites. The results obtained have high verification (77,19%) by verifying data training. This result is obtained because there is little data and verification data that is not right.
