

ABSTRACT

Fire Department and Disaster Prevention of Bandung is a service that is engaged in community services, especially rescue and fire prevention and disaster. The main users, firefighters, have long working hours and high work pressure so that they must be facilitated with facilities that are able to fulfill their duties in serving the community. The poor condition of the existing office is adjusted to government regulations, ergonomic standards and the results of a comparative study with the Fire Department office in the city of DKI Jakarta. Facilities and infrastructure are designed using the concept of 'speed and safety', to support the performance of the officers. The design results are in the form of adding educational facilities, training, storage and waiting facilities for visitors, as well as improving the space organization and material that is safe for its users.

Keywords: office, firefighter, fire, safe, speed.
