

ABSTRACT

Children in healthy Baby orphanage Bandung have no good behavior, such as cheating, lying and picking up other people's possessions. Therefore the need for action so that the habit can be eliminated. Planting learning of children was either done at an early age or can be said to be golden age, because at that age the child is able to digest the information entered well. Fadhillah (2012) reveals an effective way of learning for early childhood is to tell a story. In order to tell the story of the children's activities, there was a special technique that is very capable, the technique is Paired Storytelling. In the storytelling activities there are things that must be children mastered the skill of listening. The type of research conducted is the QUASI experiment with the design of Intact Group Comparisme. The technique of data collection was by means of tests and documentation. Technical analysis of data by means of validity test, reusability test and normality test. For hypotheses test use test Paired Sample T Test. The result of the Paired Storytelling technique on listening to the story skill is for the child to be able to understand the incoming information well and can change the behavior of the previously unwell child to be a good result of the implantation of learning outcomes.

Keywords: techniques Paired Storytelling, Quasi experiments, Intact Group comparism.
