

Abstract

The needs of the Cipacing community for health services have recently increased (cited from an interview with the Cipacing Harapan Keluarga Hospital). A good hospital certainly prioritizes the quality and quality of service to consumers. Besides, physical and interior shape also plays a role in determining the good/bad of consumers' perceptions of the hospital. At least with the physical and interior shape of a good hospital building will be able to reduce the creepy impression that accelerates the healing process. It is undeniable that space and order in which a person will be active can affect a person's behavior and activities. Every room in the hospital will have a strong influence on the behavior patterns and attitudes of people who are active in it. Thus the interior design that supports health services is increasingly needed in the face of increasingly advanced technology. One of the hospitals appointed in this project is the Harapan Keluarga General Hospital (RSU Harka) located in Cipacing, Sumedang, West Java.
