Nowadays textile fashion industry produces a variety of synthetic fabrics to comply what the fashion want and need. The progress of the fashion industry is very fast and don't think that the rest of the production to be an environment problem today. Therefore, it is important to provide education small-scale business actors related to how to solve problem and managing waste from production.

The business in bridal fashion today is bigger and bigger and lack of managing the waste. Specially designed bridal dress with intricate patterns will get the rest of the production can't be used again. This research is home data of observation textile waste mode bridal from Ferry Sunarto boutiques, Harry Ibrahim, and Harry Lam. They produced the type of materials quality fabrics such as taffeta, tulle, satin, organza, brocade, and sequin cloth.

Therefore, by using the rest of the bridal fashion production into the items that can be reused with a variety of techniques that can optimize the remaining fabric in order to help reduce environmental pollution. Because of knowing the fabric small size and many kinds of materials. The waste cloth pieces will be processed into woman's accessories
