Health is the most important thing in life, because health can make the body fit and can smoothly carry out daily activities. Therefore, health checks are needed regularly so that the disease is detected early and can be prevented from the start. Every year the population of people living in urban areas continues to increase, especially the city of Bandung, which is one of the largest cities in Indonesia and has a population of 3.7 million. However, the development of population in the city of Bandung must also be supported by good health services as well. Therefore, health agencies must improve, one of which is the design of health service advice, namely a health check car to improve the quality of health in urban communities. A special vehicle must be designed in its interior in such a way as to adjust the workmanship of the health check process which includes several aspects, namely ergonomic aspects, material aspects and functional aspects. The design method used is descriptive qualitative by taking a number of steps taken, namely through observational approaches, namely knowing the field conditions related to the issues raised and conducting the analysis phase. This design is beneficial for urban communities to maintain their health and health agencies in carrying out their duties as integrated health services

Keywords: Health Check Car, Interior, Ergonomics, Material, Function.
