

ABSTRACT

At present, information technology has been widely used by the community to help solve problems that exist in the process of an activity. Work that is usually done manually slowly changes into computerized work by the system, with the existence of the system the work becomes easier, and efficient. For example in terms of research is one of the data collection techniques that are often used by actors in the form of a questionnaire. Questionnaire preparation is done in the hope of knowing what variabel are important and the purpose of preparing the questionnaire is to improve the parts that are considered inappropriate for applied in data collection. Thus the processing of the pearson method questionnaire data can be done quickly and easily understood. In the processing of the questionnaire data with the Pearson correlation method is built using an web-based application that uses Visual Studio, by using php programming language.

Keywords: Pearson Correlation, Questionnaire, Data processing.
