

ABSTRACT

Photographic memory is the ability to remember visual events, images, colors, structures, and other things in great detail. The memory that has been recorded in the brain can then be easily retrieved whenever the information is needed. The ability that is often associated with eidetic memory into a hypothetical photographic photo memory is the timeliness and overall structure of the photo. If photographic memories exist, those who have photographic memories can remember things perfectly whenever they want. But eidetic memories are short and sometimes with errors. Therefore, the writer will present a visual city photography consisting of elements of street photography, landscape photography and Architectural photography to prove the theory.

Keywords : Photographic Memory, Eidetic Memory, Photography, Visuals.
