

ABSTRACT

Communication is a means to meet social needs. Someone can get information from the others through communication. But if the communication goes ineffective, the others will not give any information to someone. Therefore, to make a good communication with the others is hard to do without the topic of the conversation to start a communication with. Starting from these problems, an application is needed to display someone's information and there comes an idea of an application based on face recognition and augmented reality connected to the social media profile on a smart glasses to recognize the others.

In order to design this application, it will be accompanied by tests using questionnaires that will be filled directly by the respondents. Based on the results of the responses from respondents, it can be concluded that this application is in the very agree / good / like category.
