

ABSTRACT

Business Capital Donation Application is a web-based application that is used to help business owners and donors in realizing the business they want. However, in the ongoing business process there are several problems, among others, business owners have problems in funding their business. Business owners try to find funds to overcome these problems, such as applying for business loans to banks or asking for financial assistance from non-banking financial institutions that provide financing services. However, many MSMEs feel that the requirements in applying for funds to banks are very complicated. On the other hand donors also have problems in channeling their aid or funds because there are many incidents of fraud and do not get benefits. Based on these problems, an application was built to help business owners and donors in realizing their business according to their wishes. This application was built using the prototype method, MySQL database and CodeIgniter (CI) framework. Testing this application uses the black-box testing method and test results prove that this application has provided a solution to the problem. SIMOSA application can bring together business owners and donors, so that they can realize the business and get mutual *benefits*.
