

ABSTRACT

One of the efforts made by students to overcome problems in the learning process is discussion. By discussing, students can share their understanding, ideas, corrections, and opinions regarding the lecture material. This final project aims to design a discussion application prototype for students. Data collection methods used are interviews, questionnaires, observation, and literature study. After the data is obtained, then the data is analyzed in order to get some basic principles that will be used in the process of designing application interface design. In designing the user interface design of the discussion application, there are design principles that must be used and need to be considered in order to produce a good interface design and can be helpful for users.

Keywords : Interface design, discussion, design
