

ABSTRACT

The distribution of psychologists in Indonesia is very wide, with this the opportunity for different events to arise for each psychologist in handling his case. Sometimes a case that is quite strange can be used as a new experience for psychologists. The experience will be new knowledge if shared with other psychologists. Therefore, this application was created to provide a space facility for psychologists to interact with each other or discuss sharing experiences. In addition, the application contains brief information about registered psychologists, with the aim of indirectly collecting data on the distribution of psychologists in Indonesia. This application is focused on smartphones with the Android operating system and is developed using the React Native framework. The way this application works is that psychologists can use the application after successfully logging in and passing verification by the admin. With this project, it is hoped that psychologists can focus more on psychology and have their own applications as social media.
